

REVIEW

**of the Educational and Professional Program "Food Technologies"
for the second (Master's) level of higher education,
Degree: Master, Specialty 181 "Food Technologies",
Field of Knowledge 18 "Production and Technologies"
of Poltava State Agrarian University**

The submitted for review educational and professional program "Food Technologies", developed by the working group of the "Food Technologies" specialty at Poltava State Agrarian University, contains all the mandatory components and complies with the education standard requirements for this specialty. The list of competencies and the planned learning outcomes meet modern requirements for the training of specialists in the food industry, capable of solving food technology issues based on scientific research and effectively implementing innovative technologies in Ukraine's food sector.

The staffing, material and technical, informational, and educational-methodical support for the implementation of the educational and professional program, as provided in the program, ensures a high level of training for future specialists.

Considering the gradual European integration of Ukraine as a whole, and particularly of all its sectors, including the food industry, it would be advisable to include in the list of educational components a course aimed at studying technologies specifically for organic food products, as well as an in-depth study of modern methods for researching raw materials and food products. The sequence, list, and volume of courses correspond to the structural and logical scheme of training applicants for higher education in the specialty 181 "Food Technologies" and take into account modern approaches used in most European countries.

Professor, Stanka Todorova Damyanova DSc,
Department of Chemical, Food and Biotechnology,
University of Ruse "Angel Kanchev" (Razgrad Branch, Bulgaria)
